

INSTRUCTIONS:

1. Place record on its record sleeve on a clean firm surface.
2. Place 3 drops of **POWER CLEANER** on applicator. Do not apply excessive **POWER CLEANER** to the record or spots of residue may form.

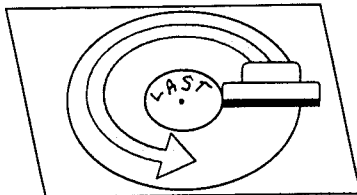

3. Spread **POWER CLEANER** evenly by moving the bottle nozzle back and forth across the applicator. Recap **POWER CLEANER** bottle.

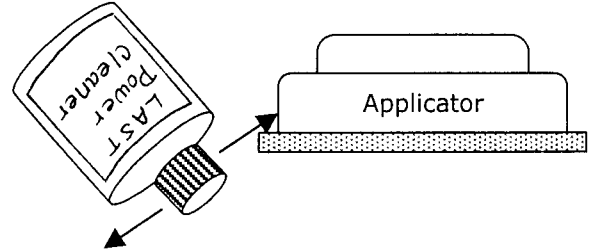

4. Clean record by moving applicator in a sweeping motion. Follow the record grooves around the record two times. Collect dust particles onto the applicator.

If record is excessively dirty use applicator to pick up debris every quarter turn of the record. Remove debris from applicator (step 5) each quarter turn.

5. Remove excess dust from applicator by moving applicator velvet across the ruffled portion of the **POWER CLEANER** bottle cap.

6. If excessive **POWER CLEANER** is applied to the record and spots of residue form, let the record dry and re-clean the record following steps 1 through 5.

Following cleaning, we recommend using **LAST RECORD PRESERVATIVE** for total protection of your power-cleaned records.

How to Clean LAST Applicators

LAST applicators can become dirty and contaminated in the process of cleaning records and applying LAST Record Preservative. They may be easily cleaned using the following operation.

Place lukewarm water in a shallow pan or bowl. Stir in a few drops of dishwashing detergent. Place dirty applicators in the container and let soak for a few minutes. Remove the applicators for the solution and gently rub the velvet faces together to dislodge soil. Rinse under cool running water; blot with paper or cloth toweling. Allow to air dry and place into use.

*Note: Keep **POWER CLEANER** out of the reach of children.*
